

# **2007 TIGER/Line® Shapefiles**

## **HOW WERE THESE FILES CREATED?**

The 2007 TIGER/Line Shapefiles are extracts containing selected geographic and cartographic information from the Census Bureau's MAF/TIGER database. The MAF/TIGER database was developed at the Census Bureau to support a variety of geographic programs and operations including functions such as mapping, geocoding, and geographic reference files that are used in decennial and economic censuses and sample survey programs. Spatial data for geographic features such as roads, railroads, rivers, and lakes, as well as legal and statistical geographic areas are included in the product. Other information about these features, such as the name, the type of feature, address ranges, and the geographic relationship to other features, also are included. The TIGER/Line Shapefiles and associated relationship files are offered in a compressed format. One zipped file is available for each layer; it has a file extension of .zip. Each zipped shapefile consists of the following five files:

- .shp - the file that stores the feature geometry
- .shx - the file that stores the index of the feature geometry
- .dbf - the dBASE, or database, file that stores attribute information
- .prj - the file that stores the coordinate system information
- .shp.xml - the file that stores the metadata

Each zipped relationship file consists of the following two files:

- .dbf - the dBASE, or database, file that stores additional attribute information
- .dbf.xml - the file that stores the metadata

## **FILE NAMING CONVENTIONS**

The name of each file is:

fe\_2007\_<extent>\_<layer>.<ext>

fe = internal US Census Bureau use

2007 = the version of the files

<extent> = entity ID code, variable length

The entity ID code identifies the geographic extent by specific entity for which the file contains data. It is of variable length depending on the type of file:

Nation-based: 2-characters, “us”

State-based: 2-digit numeric state FIPS code

County-based: 5-digit numeric state-county FIPS code

American Indian area-based: 4-digit American Indian area census code

*<layer>* = layer tag, variable length

The layer tag specifies the type of geography or feature the file contains. If '00' appears at the end of the layer tag, the file contains Census 2000 geography. If '00' does not appear, the file contains current geography.

*<ext>* = the file extension

Examples:
